

OTT Streaming Intelligence

Business Requirements Document (BRD)

1. Project Objective

To develop an interactive Power BI analytics solution that provides a comprehensive view of OTT revenue, customer, subscription, platform, content, and geographic performance. The solution will enable stakeholders to monitor KPIs, identify trends, understand customer behavior, and support data-driven decisions to improve revenue growth, customer retention, and platform performance.

2. Business Problem

The OTT business generates data across subscriptions, customers, plans, platforms, content, and geographic regions. Without a centralized analytical view, it is difficult to understand revenue trends, customer activity, subscription performance, churn, and platform contribution. This project transforms the data into an interactive Power BI dashboard for performance analysis and business decision-making.

3. Project Scope

In Scope: OTT subscription and revenue analysis; customer activity and churn; platform and plan comparison; new versus renewal subscriptions; content analysis by genre, type and language; geographic analysis; interactive Power BI dashboard; dimensional data model and DAX measures.

Out of Scope: Predictive churn modeling; customer recommendation systems; real-time streaming analytics; machine learning/AI forecasting; operational billing or payment processing.

4. Target Audience & Business Use Cases

Target Audience: Business Managers; Sales & Revenue Teams; Customer Success Teams; Content Teams; Senior Management / Decision Makers.

Use Cases: Monitor revenue and transactions; track monthly trends and growth; compare platforms and plans; monitor customer activity and churn; analyze new versus renewal subscriptions; identify high-performing regions; understand content/genre performance; identify opportunities to improve retention and revenue.

5. Key Performance Indicators

KPI	Purpose
Total Revenue	Total revenue generated from subscriptions.
Total Transactions	Number of subscription transactions.
Total Customers	Number of unique customers.
Active Customers	Customers currently classified as active.
Churned Customers	Customers classified as churned.
Churn Rate	Percentage of customers who have churned.
New Subscriptions	New subscription transactions.
Renewal Subscriptions	Renewal transactions.
Renewal Rate	Proportion of transactions that are renewals.
Revenue per Customer	Average revenue per unique customer.
Average Transaction Value	Average revenue per transaction.
YoY / MoM Revenue Growth %	Revenue growth versus previous year/month.

KPI	Purpose
Revenue YTD / MTD	Year-to-date and month-to-date revenue.
Revenue Contribution %	Platform share of total revenue.
Total Platforms	Number of OTT platforms.
Total Discount	Total discount applied to transactions.

6. Project Timeline

Day 1: Kickoff, dataset understanding and BRD.

Day 2: Power Query cleaning and transformation.

Day 3: Star Schema and relationships.

Day 4: DAX measures and KPI development.

Day 5: Dashboard development and visualizations.

Day 6: Formatting, interactivity and navigation.

Day 7: Validation, insights and final presentation.

Estimated Duration: 7 working days.

7. Project Assumptions

- The dataset represents OTT subscription and customer activity for the analysis period.
- Sale_ID represents a unique subscription transaction.
- Customer, platform, plan, content, location and date tables are treated as dimensions.
- Revenue analysis is based on cleaned Net_Revenue values.
- Customer status is used to determine active and churned customers.
- The data is assumed to be representative for demonstration of business performance analysis.
- 2026 contains partial-year data and should not be treated as a complete-year result.
- Valid dimension keys are retained even when non-key attributes are missing.
- The analysis is descriptive and historical, not predictive.
- Data-quality issues are addressed during Power Query transformation.

8. Dataset Overview

The project uses an Excel-based OTT subscription analytics dataset designed for Power BI. It follows a Star Schema with one central fact table and six dimensions.

Fact: FactSubscriptionSales — transaction-level subscription data including Sale ID, Date, Customer, Platform, Plan, Content, Location, Subscription Type, Payment Method, Quantity, Amount, Discount, Churn Flag and Net Revenue. **Grain:** one row per subscription transaction.

Dimensions: DimDate (date/calendar); DimCustomer (customer attributes and status); DimPlatform (OTT platforms); DimPlan (plans and pricing); DimContent (content attributes); DimLocation (geography).

Data Preparation: Raw data contains duplicates, missing values, inconsistent formats, incorrect types and invalid values. These are addressed in Power Query before analysis.

Final Model: The cleaned fact table connects to the six dimensions through one-to-many relationships, forming a proper Star Schema.

9. Day 1 Completion

DAY 1 — COMPLETE. Project objective, business problem, scope, target audience, use cases, KPIs, timeline, assumptions and dataset overview have been documented. Dataset loading and exploration have also been completed in Power BI.
